U.S. and international energy outlook

For
Asia-Montana Energy Summit
April 2015 | Missoula, MT

By
Adam Sieminski
U.S. Energy Information Administration
Key results from *Annual Energy Outlook 2015 (AEO2015)*

- In most AEO2015 cases, U.S. net energy imports, including all fuels, decline and ultimately end by 2030 for the first time since the 1950s
  - Strong growth in domestic production of crude oil from tight formations through 2020 and limited growth in domestic demand after 2020 leads to a decline in net petroleum and other liquids imports
  - The United States transitions from being a net importer of natural gas to a net exporter by 2017 in all cases

- U.S. energy consumption grows at a modest rate over the projection with reductions in energy intensity resulting from improved technologies and trends driven by existing laws and regulations

- Renewables provide an increased share of electricity generation, reflecting rising long-term natural gas prices and the high capital costs of new coal and nuclear generation capacity

- Improved efficiency of energy consumption in end-use sectors and a shift away from more carbon-intensive fuels help to stabilize U.S. energy-related carbon dioxide emissions, which remain below the 2005 level through 2040
Overview of AEO2015
Crude oil price projection is lower in the AEO2015 Reference case than in AEO2014, particularly in the near term.

Brent crude oil spot price
2013 dollars per barrel

Reductions in energy intensity largely offset impact of GDP growth, leading to slow projected growth in energy use.

Source: EIA, Annual Energy Outlook 2015 Reference case
U.S. net energy imports continue to decline in the near term, reflecting increased oil and natural gas production coupled with slow demand growth.
CO₂ emissions are sensitive to the influence of future economic growth and energy price trends on energy consumption.
Short-term and long-term outlook: Petroleum
Brent crude oil prices were relatively stable through the first half of 2014; increased oil supply and lower global economic growth expectations lowered prices from July 2014 to January 2015.

Source: EIA, Bloomberg
Average household energy expenditures fall by 16% in 2015, then increase somewhat in 2016 (based on EIA price forecast)

Sources: 2013 expenditures and income from BLS Consumer Expenditure Survey. The average household in the BLS survey (called a consuming unit) averages 2.5 people and 1.3 income earners. Expenditures for 2014-16 based on average prices from EIA Short-Term Energy Outlook, April 2015
Oil prices rise from mid-2015 through mid-2016 in EIA’s forecast – however, the market-implied confidence band is very wide.
Various events could lead to changes in global supply or demand that could push future crude oil prices higher or lower than the forecast.

AEO2015 explores scenarios that encompass a wide range of future crude oil price paths.

Brent crude oil spot price
2013 dollars per barrel

Source: EIA, Annual Energy Outlook 2015
U.S. crude oil production rises above previous historical highs before 2020 in all AEO2015 cases, with a range of longer-term outcomes.

Source: EIA, Annual Energy Outlook 2015
U.S. net exports of petroleum products vary with the level of domestic oil production given current limits on U.S. crude oil exports.

Source: EIA, Annual Energy Outlook 2015
Combination of increased tight oil production and higher fuel efficiency drive projected decline in oil imports

U.S. liquid fuels supply
million barrels per day

Note: “Other” includes refinery gain, biofuels production, all stock withdrawals, and other domestic sources of liquid fuels
Source: EIA, Annual Energy Outlook 2015 Reference case
Net liquid imports provide a declining share of U.S. liquid fuels supply in most AEO2015 cases; in two cases the nation becomes a net exporter.

U.S. and international energy outlook
April 2015
In the transportation sector, motor gasoline use declines; diesel fuel, jet fuel, and natural gas use all grow.

Transportation energy consumption by fuel (quadrillion Btu)

- **Motor gasoline**: 58% in 2013, projected to 44% by 2040.
- **Diesel**: 24% in 2013, projected to 31% by 2040.
- **Jet fuel**: 10% in 2013, projected to 13% by 2040.
- **CNG/LNG**: 3% in 2013, projected to 14% by 2040.
- **Other***: 4% in 2013, projected to 3% by 2040.

*Includes aviation gasoline, propane, residual fuel oil, lubricants, electricity, and liquid hydrogen.

U.S. and international energy outlook
April 2015
Most significant contributors to non-OPEC crude and lease condensate production: Canada, Brazil, U.S., Kazakhstan, Russia

non-OPEC crude and lease condensate production, Reference case
million barrels per day

All of the growth in liquid fuels consumption occurs in the emerging non-OECD (million barrels per day)

petroleum and other liquid fuels consumption, 1990-2040

million barrels per day

Non-OECD Asia and the Middle East account for 85% of the world’s growth in liquids consumption over the projection

non-OECD petroleum and other liquid fuels consumption, Reference case, 1990-2040

Short-term and long-term outlook: Natural gas
Henry Hub spot prices are expected to average $3.07/million Btu in 2015 and $3.45/million Btu in 2016.

Source: EIA, Short-Term Energy Outlook, April 2015
After cold weather caused large natural gas storage withdrawals in 2014, inventories are expected to remain within historical average levels in 2015 and 2016.

U.S. working natural gas in storage
billion cubic feet per day

Forecast
