

## Short-Term Energy Outlook (STEO)

---

### Forecast highlights

- This edition of the *Short-Term Energy Outlook* is the first to include forecasts for 2020.
- EIA forecasts Brent prices will average \$61 per barrel (b) in 2019 and \$65/b in 2020. In 2018, Brent prices averaged \$71/b. EIA expects West Texas Intermediate (WTI) crude oil prices will average \$8/b lower than Brent prices in the first quarter of 2019 before the discount gradually falls to \$4/b in the fourth quarter of 2019 and throughout 2020. EIA's forecast for the average WTI price for December 2019 of \$59/b should be considered in the context of NYMEX futures and option contract values for December 2019 delivery. NYMEX trading during the five-day period ending January 10, 2019, suggest that a range of \$28/b to \$101/b encompasses the market expectation for December 2019 WTI prices at the 95% confidence level.
- Beginning on January 1, 2020, the International Maritime Organization (IMO) is set to enact the Annex VI of the International Convention for the Prevention of Pollution from Ships (MARPOL Convention), [which lowers the maximum sulfur content of marine fuel oil](#) used in ocean-going vessels from 3.5% to 0.5%. EIA expects that, starting in the fourth quarter of 2019, this regulation will encourage global refiners to increase refinery runs and maximize upgrading of high-sulfur heavy fuel oil into low-sulfur distillate fuel to create compliant bunker fuels. EIA expects total U.S. refinery runs to increase by 4% from 2019 to reach a record level of 17.9 million barrels per day (b/d) on average in 2020, resulting in refinery utilization rates that average 96%. [EIA forecasts that one of the most significant impacts from the regulations](#) will be on diesel wholesale margins, which increase from an average of 43 cents per gallon (gal) in 2018 to 48 cents/gal in 2019 and then to 65 cents/gal in 2020. Because of the numerous and diverse set of decision makers involved in complying with the regulation and the global nature of the regulation, significant uncertainty exists about the forecast outcomes of the regulation.
- U.S. regular gasoline retail prices will average \$2.47/gal in 2019 and \$2.62/gal in 2020 in EIA's forecast, which would be a decrease from an average of \$2.73/gal in 2018.
- EIA estimates that U.S. crude oil production averaged 10.9 million b/d in 2018, up 1.6 million b/d from 2017, reaching its highest level and seeing its largest volume growth on record. EIA forecasts U.S. crude oil production to average 12.1 million b/d in 2019 and 12.9 million b/d in 2020, with most of the growth coming from the Permian region of Texas and New Mexico.

- U.S. crude oil and petroleum product net imports are estimated to have fallen from an average of 3.8 million b/d in 2017 to an average of 2.4 million b/d in 2018. EIA estimates that the United States briefly was a [net exporter of crude oil and petroleum products](#) in November 2018. EIA forecasts that net imports will continue to fall to an average of 1.1 million b/d in 2019, and to less than 0.1 million b/d in 2020. In the fourth quarter of 2020, EIA forecasts the United States will be a net exporter of crude oil and petroleum products, by about 0.9 million b/d.
- Global liquid fuels end-of-year inventories grew by an estimated 0.4 million b/d in 2018 and EIA expects they will grow by 0.2 million b/d in 2019 and by 0.4 million b/d in 2020.
- U.S. dry natural gas production averaged a record high 83.3 billion cubic feet per day (Bcf/d) in 2018. EIA forecasts dry natural gas production will average 90.2 Bcf/d in 2019 and 92.2 Bcf/d in 2020. Increases in the Appalachia and Permian regions drive the forecast growth.
- EIA forecasts that Henry Hub natural gas spot prices will average \$2.89 per million British thermal units (MMBtu) in 2019 and \$2.92/MMBtu in 2020, down from \$3.15/MMBtu in 2018. EIA's forecast for the average Henry Hub price for December 2019 of \$3.25/MMBtu should be considered in the context of NYMEX futures and option contract values for December 2019 delivery. NYMEX trading during the five-day period ending January 10, 2019, suggest that a range of \$1.85/MMBtu to \$4.80/MMBtu encompasses the market expectation for Henry Hub prices in December 2019 at the 95% confidence level.
- EIA forecasts that U.S. coal production will total 729 million short tons (MMst) in 2019, down by 25 MMst (3%) from 2018. Coal production will further decline by 50 MMst (7%) in 2020. This decrease is the result of coal's relatively weak competitiveness in the electric power sector compared with natural gas, as well as an assumption of lower demand for U.S. coal exports.
- EIA expects the share of U.S. total utility-scale electricity generation from natural gas-fired power plants to rise from 35% in 2018 to 37% in 2020. Coal's forecast share of electricity generation falls from 28% in 2018 to 24% in 2020. The nuclear share of generation was 19% in 2018 and EIA forecasts that it will be about the same share in 2020. Nonhydropower renewables provided 10% of generation in 2018 and are expected to provide 13% in 2020. Hydropower's share of generation was 7% in 2018 and is forecast to be similar in 2019 and in 2020. In 2019, EIA expects wind's annual share of generation will exceed hydropower's share for the first time.
- After increasing by 2.8% in 2018, EIA forecasts that energy-related carbon dioxide (CO<sub>2</sub>) emissions will fall by 1.2% in 2019 and by 0.8% in 2020. The declines reflect a forecast of more typical weather compared with 2018 and shifts in fuel use. Energy-related CO<sub>2</sub> emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix.

## Global Liquid Fuels

EIA estimates that global petroleum and other liquid fuels inventories increased by 1.0 million barrels per day (b/d) in the fourth quarter of 2018, contributing to downward pressure on oil prices. EIA forecasts global liquid fuels balances will continue to build in the first half of 2019 at a pace of 0.3 million b/d, before oil markets become more balanced during the second half of 2019. EIA expects inventory builds to average 0.2 million b/d in 2019 and 0.4 million b/d in 2020. The higher builds in 2020 occur as U.S. production continues to grow and the 2019 forecast declines in Organization of the Petroleum Exporting Countries (OPEC) moderate.

EIA forecasts global liquid fuels production to average 101.8 million b/d in 2019 and consumption to average 101.5 million b/d, which contributes to modest inventory builds. Production growth in 2019 is led by non-OPEC countries, particularly the United States and Brazil. EIA expects non-OPEC producers will increase oil supply by 2.4 million b/d in 2019, which will offset forecast supply declines of 1.0 million b/d from OPEC members. In 2020, the main drivers of oil production growth are expected to be the United States, Canada, Brazil, and Russia, while OPEC crude oil production is expected to remain flat.

Marine distillate use in countries outside of the Organization for Economic Cooperation and Development (OECD) will likely increase through 2020, when more stringent International Maritime Organization (IMO) specifications on sulfur levels in bunkering fuel will come into effect. Likewise, the use of high-sulfur residual fuel oil use currently used for bunkering fuel will likely decline. Also, EIA does not expect a significant switch to liquefied natural gas in 2020 as a result of the regulation. As a result, EIA does not anticipate the regulations will have a significant effect on total global liquid fuels consumption in 2020. The switch from highly energy-dense residual fuel to marine distillate will likely result in an increase in total liquid fuels consumption of no more than 0.1 million b/d, as the use of less energy-dense fuel will require some increase in volume to serve an equivalent level of shipping traffic.

Brent crude oil spot prices averaged \$71 per barrel (b) in 2018, an increase of \$17/b from 2017 levels. Daily Brent spot prices last year reached a peak of \$86/b in October 2018, which was the highest level since October 2014, before falling to nearly \$50/b by the end of the year. The price decrease in the latter part of 2018 reflected global oil inventory builds and record levels of oil production from the world's three largest producers—the United States, Russia, and Saudi Arabia—along with uncertainties about global demand growth for the coming year. EIA forecasts that Brent spot prices will gradually increase from an average of \$57/b in December 2018 to \$65/b by December 2020. Forecast Brent spot prices average \$61/b in 2019 and \$65/b in 2020.

**Global Petroleum and Other Liquid Fuels Consumption.** Global consumption of petroleum and other liquid fuels grew by 1.4 million b/d in 2018, reaching an average of 100.0 million b/d for the year. EIA expects consumption growth to average slightly above 1.5 million b/d in 2019 and in 2020. The relatively stable consumption growth reflects small forecast declines in the rate of global gross domestic product (GDP) growth from 2018, which EIA expects will be generally

offset by lower oil prices in 2019 and 2020 compared with 2018, along with increases in petrochemical related demand and IMO-related volume gain.

Non-OECD countries continue to drive demand growth in the forecast. Non-OECD liquid fuels consumption growth accounts for 1.1 million b/d of the global growth in 2019 and 1.2 million b/d in 2020, with China and India accounting for most of this growth. EIA forecasts that China's consumption will increase by 0.5 million b/d in 2019 and in 2020. EIA does not expect growth in Chinese oil consumption to slow by as much as slowing GDP growth because of the addition of a number of petrochemical plants, which will add an estimated 75,000 b/d of consumption in 2019 and an additional 70,000 b/d in 2020. EIA's forecast liquid fuels consumption in India grows by more than 0.2 million b/d in both 2019 and 2020, driven by rising use of gasoline, jet fuel, and hydrocarbon gas liquids.

OECD petroleum and other liquid fuels consumption is forecast by EIA to grow by 0.4 million b/d in 2019 and by 0.3 million b/d in 2020. The United States is the leading contributor to this forecast growth, with consumption rising by 0.3 million b/d in 2019 and by 0.2 million b/d in 2020. EIA forecasts that Europe's liquid fuels consumption will grow by 90,000 b/d in 2019 and in 2020. Japan is expected to see liquid fuels consumption decline by an average of 80,000 b/d in both years.

**Non-OPEC Petroleum and Other Liquid Fuels Supply.** EIA estimates that non-OPEC petroleum and other liquid fuels supply increased by 2.5 million b/d in 2018. Production growth of 2.2 million b/d in the United States accounted for most of the 2018 supply growth, with Canada, Russia, Kazakhstan, and Brazil collectively adding an additional 0.6 million b/d. EIA expects non-OPEC petroleum and other liquid fuels production to rise by 2.4 million b/d in 2019 and by 1.9 million b/d in 2020. Forecast growth in the United States contributes 1.7 million b/d and 1.2 million b/d, respectively, in each year, with Brazil providing another 0.3 million b/d in 2019 and 0.2 million b/d in 2020.

EIA expects Canada's total liquid fuels production to decrease by 0.1 million b/d in 2019 as a result of government-mandated production cuts in Alberta. In 2020, EIA expects Canadian production to increase by 0.2 million b/d after the cuts end in late 2019. Oil sands projects, including Horizon, Fort Hills, and Hebron, continue to drive production growth in the forecast. EIA does not expect any additional production from new upstream projects to come online during the forecast period, only expansions of existing projects.

EIA expects Brazil's petroleum and other liquid fuels production to grow by more than 0.3 million b/d in 2019 and by 0.2 million b/d in 2020. The main driver of growth in 2018 was the addition of four floating, production, storage, and offloading vessels (FPSOs). Similarly, the addition of at least five more FPSOs will continue to drive growth through 2020. Continued emphasis on the development of pre-salt resources and implementation of previous reforms, including those to local content rules, could result in higher production growth during the forecast period. EIA believes the Santos Basin, particularly the Lula field, will produce enough

crude oil in the next two years to offset declines in Brazil's more mature onshore and offshore areas.

EIA expects that during the first several months of 2019, Russia will gradually reduce production from record high levels reached during the fourth quarter of 2018. The expected reductions are a result of the agreement that Russia and other non-OPEC countries reached with OPEC members in December 2018. EIA then expects production growth in Russia to resume in the second half of 2019 and continue into 2020.

Another source of growth for non-OPEC petroleum and other liquid fuels production in the forecast period is Kazakhstan, where EIA forecasts production to ramp up in 2019 to peak production levels at the Kashagan field. Norway's production is expected to be mostly flat in 2019 and then increase by 0.1 million b/d in 2020 when the Martin Linge field and a number of smaller fields are scheduled to come online. Phase 1 of the Johan Sverdrup field, scheduled to come online by the end of 2019, drives most of the production growth in 2020. At its peak, Phase 1 will produce 0.4 million b/d. Australia, Qatar, and the United Kingdom are also expected to increase liquid fuels production in the forecast. EIA forecasts the largest declines among non-OPEC producers to be in Mexico, Indonesia, and Egypt.

**OPEC Petroleum and Other Liquid Fuels Supply.** At OPEC's meeting in June 2018, the group noted it had exceeded its previous targets for production cuts set in late 2016 and asked its members to keep reductions at targeted levels. As a result, OPEC crude oil production increased during the second half of 2018, contributing to rising global oil inventories and falling crude oil prices. In light of these market conditions, on December 7, 2018, OPEC producers and non-OPEC participants (OPEC+) announced a 1.2 million b/d cut relative to October 2018 production levels that would begin in January 2019.

EIA's production forecast does not assume full compliance with the December 2018 cuts, although EIA expects the level of production cuts will contribute to the global markets returning to more balanced conditions during the second half of 2019. EIA expects that OPEC crude oil output will decrease by 1.0 million b/d on average in 2019 and will remain flat in 2020.

Qatar left OPEC effective on January 1, 2019. Starting with this edition of STEO, Qatar's crude oil and other liquid fuels production will be included in the non-OPEC data for both history and forecast. In 2018, EIA estimates that Qatar's crude oil production averaged about 610,000 b/d, with an additional 1.3 million b/d in non-crude liquids production.

Iraq is one of the main sources of production growth among OPEC members in the extended forecast period. EIA expects increasing production capacity at the northern Kirkuk fields and a resumption of Baghdad-administered exports through the Iraqi-Kurdistan pipeline will help alleviate export capacity issues and contribute to production growth. In addition, returning capacity at domestic refineries will increase domestic crude oil demand.

After the May 2018 announcement of the U.S. withdrawal from the Joint Comprehensive Plan of Action (JCPOA) and reinstatement of sanctions on Iran in November 2018, EIA estimates that

Iranian crude oil and condensate production decreased significantly. By December 2018, Iranian crude oil production had declined by more than 1.0 million b/d from first quarter of 2018. Domestic Iranian consumption grew concurrently, as refineries increased output rates and power plants switched from natural gas to crude oil for electric power generation. For this reason, Iran's exports have fallen at a faster rate than production.

EIA assumes that U.S. sanctions on Iranian oil exports will remain in place through the end of the forecast period. Furthermore, the current forecast reflects an expectation that reduction exemption waivers issued to eight countries to continue buying Iranian oil will not be extended past May 2019.

Following reinstated sanctions on Iran and decreasing production in Venezuela, Saudi Arabia significantly increased production in the latter half of 2018, producing almost 0.8 million b/d more in November 2018 than in January 2018. On average, Saudi Arabia produced 10.4 million b/d in 2018, and EIA forecasts average Saudi production to fall below that level in 2019 and in 2020 as it complies with the latest OPEC+ production cut agreement.

As of December 2018, Venezuela's crude oil production stood at about 1.2 million b/d, near its lowest level since early 2003, when volumes fell as a result of a general strike. EIA expects Venezuela's production to continue to fall through the forecast period—albeit at a slower overall rate of decline—while the financial situation of the state-owned *Petróleos de Venezuela* (PdVSA) remains extremely precarious. Venezuela, which relies heavily on oil revenues, has seen its cash income severely constricted because only about half of its crude oil exports generate cash revenues. The rest is used for in-kind loan payments, which become less valuable with lower global oil prices. Venezuela's oil revenue is also reduced by ongoing payments to ConocoPhillips following an arbitration agreement about its seized assets and to holders of PdVSA's 2020 bonds.

In Africa, EIA expects production to increase in Angola and Nigeria through 2020. Angola's Kaombo field began production in 2018, with the second phase set to begin production in early 2019, and the Vandumbu field also came online in late 2018 ahead of schedule. Nigeria is expected to begin production at its offshore Egina project in early 2019. Libya saw production gains in 2018, albeit at marginal levels, as a result of production re-starts and development of new or previously shut-in wells. Although Libya's 2018 production level was the highest since 2012, supply disruptions will remain a significant risk during the forecast unless the security situation in the country improves.

OPEC non-crude oil liquids production averaged 5.3 million b/d in 2018 and EIA forecasts that it will remain roughly flat in 2019, and then decrease by 0.2 million b/d in 2020. The decrease in crude oil liquids next year is the result of lower expected condensate output in Iran.

OPEC unplanned crude oil supply disruptions averaged 2.2 million b/d in December 2018, an increase of 0.3 million b/d from November. The increase in outages mainly reflects new supply disruptions in Libya. In mid-December, Libya's National Oil Corporation issued a *force majeure* at El-Sharara after armed local militia attacked the oil field; the field remains occupied by local

militia. Crude oil production in Nigeria has also been affected by issues related to its oil infrastructure. In mid-2018, both the Nembe Creek Trunk Line and the Trans-Forcados pipeline were shut down to repair leaks to its pipelines, which took about three months to complete.

EIA expects that OPEC surplus crude oil production capacity, which averaged 1.5 million b/d in 2018, will increase to 1.9 million b/d in 2019 and to 2.3 million b/d in 2020. This estimate does not include additional capacity that may be available in Iran but is offline because of U.S. sanctions on Iranian oil sales.

**OECD Petroleum Inventories.** EIA estimates that OECD commercial crude oil and other liquid fuels inventories were 2.9 billion barrels at the end of 2018, equivalent to about 61 days of consumption. EIA expects OECD inventories to rise to just under 3.0 billion barrels at the end of 2019 and then rise to more than 3.0 billion barrels at the end of 2020.

**Crude Oil Prices.** The spot price of Brent crude oil averaged \$57/b in December, down from an average of \$81/b in October 2018, which was the highest level since October 2014. The price decline in late 2018 largely reflected rising oil inventories as a result of record levels of crude oil production from the United States, Russia, and Saudi Arabia. Prices also fell as a result of uncertainties about global economic indicators and future oil demand growth.

Although OPEC+ producers announced in early December plans to cut production starting in January 2019, Brent crude oil prices continued to fall after the announcement. The price declines possibly reflected market expectations that announced production decreases would not be enough to offset increasing production levels in North America, along with the potential for weakening global oil demand growth, which could lead to continued growth in global oil inventory levels.

EIA estimates that global petroleum and other liquid fuels inventories rose by an average of 0.4 million b/d in 2018 and by an estimated 1.0 million b/d in the fourth quarter of 2018. EIA expects [strong growth in U.S. and other non-OPEC liquid fuels production](#) will contribute to global oil inventory growth of 0.2 million b/d in 2019 and 0.4 million b/d in 2020. However, EIA expects some of these inventories to be unavailable to the market because they will be the result of Iran increasing floating storage of crude oil that it cannot sell as a result of U.S. sanctions.

Given the expectation of relatively balanced markets in 2019 and 2020, with modest inventory builds, EIA forecasts Brent crude oil prices will remain lower than levels experienced during most of 2018, averaging \$61/b in 2019 and \$65/b in 2020. Although prices are forecast to remain lower than those experienced during most of 2018, some upward price movements from December 2018 price levels are expected to emerge in early 2019 from the need for global oil inventories to rise slightly to keep pace with demand growth and maintain five-year average levels of demand cover. Additional upward price moves are forecast in late 2019 and early 2020 because of an increase in refinery demand for light-sweet crude oil as a result of IMO regulations.

Daily and monthly average crude oil prices could vary significantly from annual average forecasts because global economic developments and geopolitical events in the coming months have the potential to push oil prices higher or lower than the current STEO price forecast. Uncertainty remains regarding how much oil the U.S. sanctions on Iran will take off the market following the expiration of waivers in the first half of 2019. In addition, questions remain regarding the duration of, and adherence to, the current OPEC+ production cuts. Developments regarding the rate of economic growth and its effect on global oil demand growth further contribute to price uncertainty. Also, although EIA expects crude oil price impacts from IMO regulations starting in 2020 to be limited, there remain many unknowns about how the global refining and shipping industries will respond, and actual outcomes of these decisions will affect crude oil prices. Finally, the U.S. tight oil sector continues to be dynamic, and quickly evolving trends in this sector could affect both current crude oil prices and expectations for future prices.

After averaging more than \$10/b during October 2018, the discount of West Texas Intermediate (WTI) crude oil prices to Brent fell to an average of \$8/b in December. Average WTI crude oil prices are forecast to be \$6/b lower than Brent prices in 2019 and \$4/b lower than Brent prices in 2020. The price discount of WTI to Brent in the forecast is based on the assumption that [increasing crude oil production in the Permian Basin](#) and [current constraints on the capacity to transport crude oil](#) from production areas in West Texas and from Cushing, Oklahoma, to refineries and export terminals along the U.S. Gulf Coast will persist until mid-2019. At that point, EIA expects that new takeaway capacity will come online from West Texas to the Gulf Coast that will reduce current distribution bottlenecks throughout Texas and Oklahoma.

The current values of futures and options contracts suggest significant uncertainty in the oil price outlook. WTI futures contracts for April 2019 delivery that were traded during the five-day period ending January 10 averaged \$51/b, and implied volatility averaged 44%. These levels established the lower and upper limits of the 95% confidence interval for the market's expectations of monthly average WTI prices in April 2019 at \$36/b and \$73/b, respectively. The 95% confidence interval for market expectations widens over time, with lower and upper limits of \$28/b and \$101/b, respectively, for prices in December 2019.

## U.S. Liquid Fuels

**Consumption.** EIA forecasts that total U.S. petroleum and other liquid fuels consumption will average 20.8 million barrels per day (b/d) in 2019, an increase of 310,000 b/d (1.5%) from the 2018 level. Consumption is forecast to grow by 240,000 b/d (1.1%) in 2020. Higher forecast consumption of hydrocarbon gas liquids (HGL) is the primary reason for the growth.

HGL consumption increased by an estimated 330,000 b/d (12.6%) in 2018 and EIA expects it to increase by 160,000 b/d (5.5%) in 2019 and by 180,000 b/d (5.7%) in 2020. Ethane, used as a petrochemical feedstock, is expected to be responsible for most of the growth in HGL consumption. Ethane consumption increased by an estimated 230,000 b/d in 2018 because several [new petrochemical steam cracking plants](#) ramped up operations. EIA anticipates that several more plants, which are currently under construction, will begin operations within the

forecast period, resulting in ethane consumption increasing by 180,000 b/d in 2019 and by another 160,000 b/d in 2020.

Motor gasoline consumption in the United States is forecast by EIA to increase slightly in 2019, averaging more than 9.3 million b/d. If realized, this level would represent the highest annual average U.S. motor gasoline consumption on record. Motor gasoline consumption is supported by growth in income and employment. Forecast real disposable income increases by 2.9% in 2019 and by 2.5% in 2020, and forecast employment grows by 1.5% and 1.1%, respectively, during those years. Retail gasoline prices for all grades are forecast to decline by 8.3% compared with 2018 levels, which also contributes to motor gasoline consumption growth in 2019. In 2020, gasoline prices are expected to rise by 6.2%, which, along with rising vehicle fuel efficiency, offsets employment growth effects and keeps forecast gasoline demand unchanged compared with 2019.

Distillate fuel consumption in the United States is expected by EIA to rise by 0.6% in 2019 and 0.7% in 2020, averaging about 4.2 million b/d in both years. In 2019, rising U.S. distillate fuel consumption results from forecast economic growth. In 2020, distillate consumption growth reflects expectations of rising economic growth, along with a small expected shift to use of marine diesel for bunkering purposes as a result of IMO regulations.

EIA forecasts U.S. jet fuel consumption to grow in by 4.2% in 2019 and by 1.3% in 2020, reaching more than 1.8 million b/d. Growth in the demand for air travel is a result, in part, of expectations of rising disposable income.

U.S. residual fuel use is expected to decline by 0.9% in 2020 according to the EIA forecast. The small declines in 2020 reflect a shift away from high-sulfur residual fuel oil for bunkering purposes towards marine diesel fuel.

**Crude Oil Supply.** EIA estimates that U.S. crude oil production averaged 10.9 million b/d in 2018, up 1.6 million b/d from 2017, surpassing the previous record level of annual production set in 1970. EIA forecasts total U.S. crude oil production to average 12.1 million b/d in 2019, up 1.1 million b/d from 2018. In 2020, crude oil production is forecast to average 12.9 million b/d. If the domestic and global forecasts are realized, crude oil production at these levels would allow the United States to maintain its status as the world's leading crude oil producer in both years.

Increased crude oil production from tight rock formations within the Permian region in Texas and New Mexico accounts for 0.6 million b/d of the U.S. total growth expected by EIA in 2019, and 0.5 million b/d in 2020. The remaining increase comes from the Bakken, Eagle Ford, Niobrara, and Anadarko regions and also from the Federal Gulf of Mexico.

EIA expects the Permian region to produce 4.8 million b/d of crude oil by the end of 2020, which is about 1.0 million b/d more than estimated December 2018 levels and would represent about 36% of total U.S. crude oil production at the end of 2020. Favorable geology and technological and operational improvements have allowed the Permian to become one of the most economic regions for oil production. However, the forecast annual growth rate in 2019 is 0.6 million b/d,

which is 0.4 million b/d slower than in 2018. The flattening of the growth rate reflects increasing pipeline capacity constraints in the Permian region, which are expected to lower wellhead prices for the region's oil producers and to have a dampening effect on Permian's full production potential in the short term. The widening spread between WTI-Cushing and WTI-Midland crude oil prices contributes to reduce drilling activity growth through the forecast period, which, in turn, slows the rate of forecasted crude oil production growth. In addition, lower forecast WTI price levels in 2019 and in 2020, compared with 2018, lead to an expectation for a slower growth rate. However, with the expectation that pipeline capacity constraints in the Permian are expected will be alleviated in the second half of 2019, EIA forecasts that growth will accelerate on a monthly basis into 2020.

Production in the Eagle Ford region is forecast by EIA to increase by almost 90,000 b/d to 1.4 million b/d in 2019 and then fall slightly in 2020. The Eagle Ford region covers a significantly smaller geographic area with fewer prolific formations and fewer opportunities to drill compared with the Permian region. Although the Eagle Ford region does not have the same pipeline capacity constraints as the Permian region, it is more strongly affected by lower overall WTI-Cushing prices because of its less favorable geology.

EIA estimates the Bakken region, located mostly in North Dakota, produced 1.3 million b/d in 2018 and that production will increase to 1.4 million b/d in 2019 and nearly 1.5 million b/d in 2020. Recent growth in the region reflects the removal of pipeline capacity constraints that affected the region before 2017. However, the Bakken region contains fewer identified prolific formations than the Permian region and is more significantly affected by lower prices and winter weather. Growing capacity constraints for natural gas capture in the region are expected to reduce production growth until the end of 2019, compared with an unconstrained environment.

EIA expects production from the Federal Gulf of Mexico to average of 1.9 million b/d in 2019 and 2.2 million b/d in 2020, up from an average of 1.7 million b/d in 2018. In 2018, 11 new projects came online contributing to record high production in the region. In 2019, 6 more projects are expected to come online, and 12 more projects are expected to start up in 2020.

Elsewhere, EIA expects growth from 2018 through 2020 in the Niobrara and Anadarko regions. Crude oil production in Alaska is expected to remain flat at 0.5 million b/d in 2019 and in 2020.

**Hydrocarbon Gas Liquids Supply.** EIA forecasts [HGL production at natural gas processing plants](#) will increase from an estimated 4.4 million b/d in 2018 to 5.0 million b/d in 2019 and to 5.3 million b/d in 2020. HGLs produced at natural gas plants—ethane, propane, butanes, and natural gasoline—are expected to increase along with growth in natural gas production and natural gas processing plant capacity. EIA expects ethane to contribute nearly half of the 900,000 b/d HGL production growth between 2018 and 2020. Higher rates of ethane recovery at natural gas processing plants are expected to help meet growing demand for ethane as a petrochemical feedstock in the United States and abroad.

**Liquid Biofuels.** On November 30, 2018, the U.S. Environmental Protection Agency (EPA) finalized a rule setting Renewable Fuel Standard (RFS) volumes for 2019 and biomass-based

diesel volumes for 2020. EIA used these final volumes to develop the forecasts for 2019 and 2020. EIA expects that the largest effect of the current RFS targets, along with recent duties placed on biodiesel imports, will be on biomass-based diesel production and net imports, which help to meet the RFS targets for use of biomass-based diesel, advanced biofuel, and total renewable fuel. Biodiesel production averaged an estimated 123,000 b/d in 2018 and is forecast to increase to an average of 144,000 b/d in 2019 and to 158,000 b/d in 2020. Largely because of duties imposed on foreign biodiesel imports from Argentina and Indonesia in late 2017, net imports of biomass-based diesel fell from an estimated 32,000 b/d in 2017 to 16,000 b/d in 2018 and are expected remain near that level in 2019 and in 2020.

U.S. ethanol production averaged an estimated 1.05 million b/d in 2018 and EIA forecasts that it will average about 1.04 million b/d in both 2018 and 2019 as a result of low ethanol producer margins and limited domestic growth potential. Ethanol consumption averaged about 940,000 b/d in 2018 and is forecast by EIA to increase slightly to 950,000 b/d in 2019 and in 2020 driven by increasing motor gasoline consumption. This level of consumption results in the ethanol share of the total gasoline pool increasing slightly from 10.1% in 2018 to 10.2% in 2020. This stable ethanol share assumes growth in higher-level ethanol blends is limited by recently waived volumes of renewable fuel required under the RFS by way of numerous Small Refinery Exemptions, depressing D6 Renewable Identification Number (RIN) prices and limiting the demand for higher levels of ethanol blending beyond 10% of gasoline (i.e., E10).

**Product Prices.** EIA expects the retail price of regular gasoline in the United States to average \$2.30 per gallon (gal) during the first quarter of 2019, 28 cents/gal lower than at the same time last year, primarily reflecting lower crude oil prices and lower refinery margins. EIA expects that the U.S. monthly retail price of regular gasoline will increase from an average of \$2.24/gal in January to a 2019 peak of \$2.59/gal in August before falling to \$2.42/gal in December 2019. The U.S. regular gasoline retail price, which averaged \$2.73/gal in 2018, is forecast to average \$2.47/gal in 2019 and \$2.62/gal in 2020.

Regional annual average forecast prices for 2019 range from a low of \$2.22/gal in the Gulf Coast region—[Petroleum Administration for Defense District \(PADD\) 3](#)—to a high of \$2.94/gal in the West Coast region (PADD 5).

Refinery wholesale gasoline margins in the United States (the difference between the wholesale price of gasoline and the price of Brent crude oil) averaged 13 cents/gal in December. This level was lower than the 19 cents/gal average in December 2017 and 8 cents/gal lower than the five-year (2013–17) average for December. Refinery wholesale gasoline margins averaged 28 cents/gal in 2018, which was 12 cents/gal lower than the 2017 level and 8 cents/gal lower than the five-year average. EIA expects refinery wholesale gasoline margin to average 29 cents/gal in 2019 and 33 cents/gal in 2020.

The diesel fuel retail price averaged \$3.18/gal in 2018, which was 53 cents/gal higher than the average in 2017. EIA forecasts that the diesel price will average \$2.94/gal in 2019 and \$3.13/gal in 2020. The rising prices from 2019 to 2020 reflect a forecast increase in crude oil prices, tight

distillate fuel inventory levels, and increasing diesel refinery margins driven by impending IMO 2020 regulations. EIA expects that low-sulfur IMO regulations set to begin in 2020 will drive global demand for U.S. ultra-low sulfur diesel volumes and contribute to gradually increasing diesel refinery margins. Diesel refinery margins based on Brent crude oil, which averaged 43 cents/gal in 2018, are expected to average 48 cents/gal in 2019 and 65 cents/gal in 2020.

## Natural Gas

**Natural Gas Consumption.** Total U.S. natural gas consumption averaged an estimated 81.6 billion cubic feet per day (Bcf/d) in 2018, and EIA expects it to increase by 1.1 Bcf/d (1.3%) in 2019 and then increase by a further 0.9 Bcf/d (1.1%) in 2020.

The largest natural gas consuming sector in the United States is the electric power sector. EIA estimates that electric generation consumed an average of 29.0 Bcf/d in 2018, up 14.4% from 2017 because of warm summer temperatures in 2018 and the addition of natural gas-fired electric generation capacity. EIA forecasts power sector consumption of natural gas to remain largely unchanged in 2019 and then rise by 3.3% in 2020 because of continuing increases in natural gas-fired electric generation capacity.

In 2019, EIA expects residential and commercial natural gas consumption to average 13.4 Bcf/d and 9.3 Bcf/d, respectively, which are similar to consumption levels in 2018. Based on forecasts by the National Oceanic and Atmospheric Administration (NOAA), EIA forecasts 2019 heating degree days (HDD) to be 1% lower compared with 2018. The [cold weather](#) in the first quarter of 2018 raised natural gas consumption higher than seasonal norms in the residential and commercial sectors in the Northeast. Natural gas consumption in the residential and commercial sectors is expected to decline by 2.2% and by 3.2%, respectively, in 2020. The forecast decline in 2020 reflects NOAA's outlook for 1% fewer HDDs in 2020 compared with 2019.

EIA forecasts U.S. industrial sector consumption of natural gas to rise by 2.0% in 2019 and by 0.9% in 2020. Most of the increase in the forecast is attributable to new chemical projects. Low natural gas prices in recent years have made it economical to increase the use of natural gas as feedstock in ammonia for nitrogenous fertilizer and methanol manufacturers. According to S&P Platts, three methanol plants are currently under construction with in-service dates in 2019 and in 2020. The combined capacity of the three plants is almost 3.3 million metric tons per year, a 45% increase from the current U.S. capacity. Big Lake 1 in Louisiana and Liberty One 1 in West Virginia are expected to enter service in 2019. The Big Lake facility will convert dry natural gas into methanol, then to conventional gasoline. Liberty One 1 is a facility relocation from Rio De Janeiro, Brazil. Yuhuang's St. James 1 methanol plant is expected to enter service in mid-2020, and it would be the second-largest methanol facility in the United States, after the facility in Beaumont, Texas, which entered service in June 2018.

**Natural Gas Production and Trade.** EIA estimates that dry natural gas production will average 90.2 Bcf/d in 2019, an 8.3% increase from 2018 levels. In 2020, production is expected to increase by 2.2%, averaging 92.2 Bcf/d for the year. EIA's expected growth in natural gas production is largely in response to improved drilling efficiency and cost reductions, higher

associated gas production from oil-directed rigs, and increased takeaway pipeline capacity from the highly productive Appalachia and Permian production regions. Forecast natural gas production growth is supported by planned expansions in liquefied natural gas (LNG) capacity and increased pipeline exports to Mexico.

The United States exported more natural gas than it imported in 2018, with net exports averaging 2.1 Bcf/d. Rising LNG exports and pipeline exports have contributed to a shift from the United States being a net importer of natural gas as recently as the first quarter of 2017. U.S. exports of natural gas, including exports to Mexico and Canada via pipeline and as LNG, averaged 10.0 Bcf/d in 2018. EIA forecasts that gross U.S. exports will rise by 31.5% to 13.2 Bcf/d in 2019 and then by 15.1% to 15.2 Bcf/d in 2020.

EIA expects U.S. LNG exports to increase from an estimated 3.0 Bcf/d in 2018 to 5.1 Bcf/d in 2019 and to 6.8 Bcf/d in 2020, as three new liquefaction projects come online. EIA forecasts that U.S. LNG export capacity will almost double by the end of 2019 to 8.9 Bcf/d once new trains at Cameron LNG, Freeport LNG, and Elba Island LNG are commissioned, making U.S. LNG export capacity the third largest in the world behind Australia and Qatar. By mid-2020, EIA expects U.S. LNG export capacity to reach 9.6 Bcf/d once the third train at Freeport LNG comes online and to expand to 10.2 Bcf/d by mid-2020 once the third train at Corpus Christi LNG comes online.

U.S. natural gas exports to Mexico via pipeline have also increased as more infrastructure has been built to transport natural gas both to and within Mexico. U.S. pipeline exports to Mexico through October averaged 4.6 Bcf/d, increasing by 10% in 2018 compared with the same period in 2017. Exports to Mexico should continue to increase as more natural gas-fired power plants come online in Mexico and more pipeline infrastructure within Mexico is built.

U.S. net natural gas pipeline imports from Canada decreased from 2017 to 2018. This decrease in net imports is expected to continue as Appalachian production growth displaces some Canadian natural gas imports in the U.S. Midwest markets.

**Natural Gas Inventories.** As of January 4, 2019, U.S. working gas inventories were 2,614 Bcf, 7% lower than their year-ago level and 15% lower than the five-year (2014–18) average level. Based on an assumption of relatively normal temperatures in the first quarter of 2019, along with a forecast of growing natural gas production, EIA forecasts that inventories will be 1,405 Bcf at the end of March, which would be 15% lower than the five-year average for that time of year. EIA expects inventory injections to exceed the five-year average rate, as production outpaces consumption from the end of March through October, bringing inventories to a projected 3,758 Bcf at the end of October 2019, which would be slightly above the previous five-year average for the end of October and 16% more than at the end of October 2018.

**Natural Gas Prices.** Henry Hub spot prices averaged \$3.15 per million British thermal units (MMBtu) in 2018, up 16 cents/MMBtu from 2017 levels. EIA forecasts that Henry Hub natural gas spot prices will average \$2.89/MMBtu in 2019 and \$2.92/MMBtu in 2020. Forecast prices are lower than 2018 levels as expected production growth keeps pace with demand and export growth and inventories build faster than the five-year average. Natural gas futures contracts for

April 2019 delivery that were traded during the five-day period ending January 10 averaged \$2.69/MMBtu. Current options and futures prices indicate that market participants place the lower and upper bounds for the 95% confidence interval for April 2019 contracts at \$2.06/MMBtu and \$3.53/MMBtu, respectively. Last year at this time, the natural gas futures contracts for April 2018 delivery averaged \$2.75/MMBtu, and the corresponding lower and upper limits of the 95% confidence interval were \$2.01/MMBtu and \$3.75/MMBtu, respectively.

## Coal

**Coal Supply.** EIA estimates that coal production declined by 20 million short tons (MMst) (3%) in 2018, despite a 19 MMst increase in U.S. coal exports. Appalachian region coal production, based largely on the strength of growth in coal exports, increased for the second year in a row, but Interior and Western region production declined by 5% and 3% in 2018, respectively. In both 2019 and in 2020, EIA expects total U.S. coal production to decline by 3% and 7%, respectively, because of anticipated declines in both exports and domestic consumption. The 2020 forecast production of 680 MMst would be the first time annual production totaled less than 700 MMst since 1978.

**Coal Consumption.** EIA estimates that coal consumption in the electric power sector for 2018 declined by 24 MMst (4%), despite a 4% increase in overall electricity generation. EIA expects power sector coal consumption to decline by 52 MMst (8%) in 2019 and by 44 MMst (7%) in 2020. The decrease in power sector consumption reflects increasing shares of electricity generation from both natural gas and renewable energy sources.

**Coal Trade.** The United States, with excess coal production and export terminal capacity, is a swing supplier of coal to the global market. When market conditions are favorable (high global coal prices, low shipping costs, disruptions in supply from other exporters, and/or increased demand from major consumers), U.S. coal exports often expand. However, exports often contract with a reversal of these market factors. EIA estimates that U.S. coal exports were 116 MMst in 2018, 20% higher than the amount exported in 2017, marking the fourth time on record that annual exports exceeded 110 MMst. EIA expects that some market conditions that favor U.S. coal exports will diminish and forecasts that coal exports will decline to 102 MMst in 2019 and to 94 MMst in 2020.

Despite EIA's overall forecast decline in U.S. coal exports, [exports to Asia](#), particularly to India, Japan, and South Korea, are expected to remain strong. Exports to these three countries accounted for 33% (29 MMst) of the [coal exported in 2018 through September](#). Coal exports to other countries/regions have also increased recently. U.S. coal exports to North Africa, particularly Egypt and Morocco, have risen, and they accounted for 7% of total exports in 2018 through September. Comparatively, coal exports to Canada and Mexico accounted for 9% of total exports during the same period.

**Coal Prices.** EIA estimates the delivered coal price to U.S. electricity generators averaged \$2.07 per million British thermal units (MMBtu) in 2018, which was 1 cent/MMBtu higher than the 2017 price. EIA forecasts that coal prices will be close to the same in 2019 and in 2020.

## Electricity

**Electricity Consumption.** EIA expects annual retail sales of electricity to the U.S. residential sector in 2019 to be 3.1% lower than residential sales in 2018, primarily as a result of milder expected summer temperatures this year. The National Oceanic and Atmospheric Administration (NOAA) projects that total U.S. cooling degree days (CDD) during 2019 will be 13% lower than in 2018. NOAA expects that U.S. heating degree days (HDD) will be slightly lower in 2019 than in 2018, contributing to the lower residential consumption forecast in 2019.

The milder expected summer weather in 2019 also affects the forecast for retail sales of electricity to the commercial sector, which is expected to decline by 0.7% this year. Reduced need for air conditioning in the commercial sector is partly offset by continued economic growth. EIA forecasts that industrial production by electricity-intensive industries will grow 3.7% in 2019 compared with 2.8% growth last year. This accelerated expansion contributes to EIA's forecast that retail sales of electricity to the industrial sector will grow by 0.9% in 2019.

NOAA forecast temperatures in 2020 are relatively close to the 10-year average, with 2020 HDDs falling slightly from 2019 and 2020 CDDs increasing slightly from 2019. EIA forecasts that residential and commercial electricity sales in 2020 will grow by 0.9% and 0.4%, respectively, as a result of an increasing number of retail customers and continued economic growth. Forecast industrial electricity sales fall by 0.3% in 2020 as growth in electricity-intensive industrial production slows.

Overall, EIA forecasts total electricity consumption to decline by 1.2% in 2019 from 2018 levels and then rise by 0.5% in 2020.

**Electricity Generation.** EIA expects total U.S. electricity generation across all sectors to average 11.3 gigawatthours per day (GWh/d) in 2019, which would be 1.9% less than generation last year. From 1980 through 2005, U.S. electricity generation grew by an average of 2.3% per year. During the past decade, power generation has grown relatively little, fluctuating at an annual average of about 11.2 GWh/d since 2010 with year-to-year changes related to weather. EIA forecasts U.S. electricity generation will grow by 0.3% between 2019 and 2020.

The share of U.S. electricity generation supplied by natural gas-fired power plants has increased significantly during the past decade, rising from 24% of total generation in 2010 to an estimated 35% in 2018. This increase in the share of generation has been offset by reduced generation from coal-fired power plants. Coal supplied 45% of U.S. generation in 2010, compared with an estimated 28% in 2018. Much of this change in the mix of generation is a result of sustained low prices for natural gas, which have made that fuel competitive with coal.

EIA expects this trend in the U.S. generation mix to generally continue. EIA forecasts that the natural gas-fired share of generation will average 36% in 2019 and 37% in 2020. The forecast share of generation from coal-fired power plants averages 26% in 2019 and 24% in 2020.

EIA expects the nuclear share of generation to average 19% in 2019 and then to fall slightly in 2020 in response to the planned retirement of generating units at the Pilgrim and Three Mile Island nuclear plants.

**Renewables Generation and Capacity.** Renewable generation provided 17% of total electricity generation in 2018, and EIA expects the share of generation from renewable sources to increase in 2019 to 18% and to 20% in 2020. Within the renewables category, hydropower was 7% of total generation in 2018 and EIA forecasts that it will be about that share in 2019 and in 2020. The share of total generation for renewables other than hydropower, which was 10% in 2018, is forecast to rise to 11% in 2019 and to 13% in 2020.

EIA forecasts almost 5 gigawatts (GW) of utility-scale solar photovoltaic (PV) capacity will be added in 2019 and 6 GW will be added in 2020. Also, EIA expects nearly 9 GW of small-scale solar PV capacity to be installed during 2019–20, mostly in the residential sector.

Domestic PV markets are still adjusting from several factors. Tariffs on PV modules imported into the United States started at 30% in January 2018 and are expected to decline 5 percentage points annually as they phase out over four years and expire completely after 2021. In addition, revised PV installation targets in China produced a near-term surplus of PV modules that the international market is still rebalancing. The Internal Revenue Service published a safe harbor provision for PV installations to qualify for a 30% investment tax credit, which allows for a four-year construction period upon project initiation (considered to be the start of physical construction or the expenditure of 5% of project value).

EIA expects wind capacity to increase from 96 GW at the end of 2018 to 107 GW at the end of 2019 and to 114 GW by the end of 2020. Because wind capacity is often added at the end of the calendar year, increases in generation frequently lag increases in capacity for the year they occur and are reflected in the generation for the next year.

The build out of new wind capacity through 2020 is strongly affected by the phase out of the federal Production Tax Credit (PTC) for wind, which began with projects under construction starting after 2016. Such projects take several years to complete, and the last tranche of projects eligible for the full \$25 per megawatt-hour tax credit will start to enter service in significant numbers in 2019. Activity will taper off in later years as projects started in 2016 approach the limit of their safe harbor provisions and as the construction pipeline begins to shrink, reflecting reduced PTC pay offs for projects beginning construction in 2017 and later.

**Electricity Retail Prices.** EIA's forecast U.S. retail electricity price for the residential sector averages 13.3 cents/kilowatt-hour in 2019, which is 2.7% higher than the average retail price in 2018. Forecast residential prices increase by an additional 1.8% in 2020. EIA expects commercial sector electricity prices to increase by 0.5% in 2019 and to fall by 0.1% in 2020, while forecast industrial prices increase by 0.3% and 1.1% during the next two years, respectively.

## U.S. Economic Assumptions and Energy-Related Carbon Dioxide Emissions

**Recent Economic Indicators.** Real gross domestic product (GDP) increased at an annual rate of 4.2% in the second quarter of 2018 and 3.4% in the third quarter, according to [recent estimates released by the Bureau of Economic Analysis](#).

**Production, Income, and Employment.** EIA used the December 2018 version of the IHS Markit macroeconomic model with EIA's energy price forecasts as model inputs to develop the economic forecasts in STEO.

Using the IHS Markit model, EIA forecasts real GDP to grow by 2.7% in 2019 and by 2.0% in 2020, compared with 2.9% growth in 2018. Total industrial production is forecast to increase 3.2% in 2019 and 1.7% in 2020—down from 3.9% growth in 2018. Nonfarm employment, which grew by an estimated 1.6% in 2018, is forecast to increase by 1.5% in 2019 and by 1.1% in 2020.

**Expenditures.** Using the IHS Markit model, EIA forecasts private real fixed investment to grow by 3.0% in 2019 and by 3.8% in 2020, compared with 5.2% growth estimated for 2018. Real consumption expenditures, which grew by an estimated 2.7% in 2018, are forecast to grow by 3.0% in 2019 and by 2.6% in 2020.

Using the IHS Markit model, EIA forecasts U.S. exports to grow by 3.9% in 2019 and by 4.7% in 2020, compared with 4.1% growth in 2018. Imports are forecast to grow by 6.4% in 2019 and by 7.1% in 2020, compared with 4.8% growth in 2018. Total government expenditures are forecast to increase by 2.6% in 2019 and by 0.9% in 2020, compared with an increase of 1.7% in 2018.

**Energy-Related Carbon Dioxide Emissions.** After increasing by 2.8% in 2018, EIA forecasts that energy-related carbon dioxide (CO<sub>2</sub>) emissions will decrease by 1.2% in 2019 and further decrease by 0.8% in 2020. Energy-related CO<sub>2</sub> emissions are sensitive to changes in weather, economic growth, energy prices, and fuel mix. In 2018 the winter was colder and the summer hotter than in 2017, and the economy grew by almost 3%—contributing to higher CO<sub>2</sub> emissions. As forecast weather is closer to normal and economic growth moderates, emissions are forecast to decline. Also, the change in fuel mix for electricity generation helps to dampen CO<sub>2</sub> emissions growth in 2019 and 2020.

### Notable forecast changes

- For more information, see the [detailed table of forecast changes](#).

## Petroleum and natural gas markets review

### Crude oil

**Prices:** The front-month futures price for Brent crude oil settled at \$61.68 per barrel (b) on January 10, 2019, a decrease of 1 cent/b from December 3, 2018. The front-month futures price for West Texas Intermediate (WTI) crude oil for delivery at Cushing, Oklahoma, decreased by 36 cents/b during the same period, settling at \$52.59/b on January 10 (**Figure 1**).

 CME Group and Intercontinental Exchange, as compiled by Bloomberg L.P.

After stabilizing briefly following the Organization of the Petroleum Exporting Countries' (OPEC) [agreement](#) in early December to voluntarily reduce oil production starting in January 2019, crude oil prices rapidly declined in the final weeks of 2018. Historical crude oil futures price volatility reached its highest levels since the first quarter of 2016. Similar to that quarter, recent weakness in global economic indicators could indicate a slowdown in economic growth and oil demand. China's manufacturing [Purchasing Managers' Index](#) for [December](#) fell to 49.7, where any reading below 50 indicates a contraction in manufacturing activity. Recent trade data show, however, that OPEC crude oil exports declined about 10% from November to December, suggesting OPEC members began reducing oil production ahead of the scheduled reductions in 2019. These supply reductions may have contributed to the oil price increase at the beginning of January, returning to levels just before the December 7 OPEC meeting.

### Petroleum products

**Gasoline prices:** The front-month futures price of reformulated blendstock for oxygenate blending (RBOB, the petroleum component of gasoline used in many parts of the country) settled at \$1.43 per gallon (gal) on January 10 (**Figure 2**), mostly unchanged from December 3. The RBOB–Brent crack spread (the difference between the price of RBOB and the price of Brent crude oil) was also mostly unchanged during the same period, settling at -4 cents/gal.

eia CME Group, as compiled by Bloomberg L.P., RBOB=reformulated blendstock for oxygenate blending

The RBOB–Brent crack spread averaged 1 cent/gal in December, the lowest for that month since 2008. STEO estimates U.S. gasoline consumption decreased 2% year-over-year in December, bringing estimates of full-year 2018 U.S. gasoline consumption to show a decline compared with 2017, the [first annual decline](#) since 2012. Exports continue to remain an important source of demand growth for U.S. refiners, however. Weekly estimates of gasoline exports reached an [all-time high](#) in early December, totaling more than 1.3 million barrels per day.

**Ultra-low sulfur diesel prices:** The ultra-low sulfur diesel (ULSD) front-month futures price for delivery in New York Harbor settled at \$1.91/gal on January 10 (**Figure 3**), an increase of 2 cents/gal from December 3. The ULSD–Brent crack spread (the difference between the price of ULSD and the price of Brent crude oil) increased by 2 cents/gal to settle at 44 cents/gal during the same period.

eia CME Group, as compiled by Bloomberg L.P., ULSD=ultra-low sulfur diesel

ULSD–Brent crack spreads fell in late December, but remained higher than the five-year (2013–17) average for December, averaging 43 cents/gal. STEO estimates U.S. distillate consumption was virtually unchanged year-over-year in December, at 4 million b/d, but estimates of full-year distillate consumption in 2018 were at the [highest levels since 2007](#). Distillate inventories were 5% less than the five-year average at the end 2018, which could contribute to higher distillate prices or crack spreads if colder-than-normal weather leads to higher home heating oil consumption in the coming months.

## Natural Gas

**Prices:** The front-month natural gas futures contract for delivery at the Henry Hub settled at \$2.97/million British thermal units (MMBtu) on January 10, a decrease of \$1.37/MMBtu from December 3 (**Figure 4**). Colder-than-normal weather and below-average inventory levels resulted in higher prices and [volatility](#) in November and through early December. However, milder temperatures in the second half of December contributed to substantial decreases in prices, returning them to September levels. For the three weeks ending January 3, U.S. heating degree days were 20% less than normal. The moderate weather also helped to slow the rate of inventory withdrawals. Natural gas inventory withdrawals were 256 billion cubic feet (Bcf) less than the previous five-year average for the three weeks ending January 4, helping to narrow the deficit from the five-year average to 464 Bcf for the week ending January 4 from 725 Bcf for the week ending November 30.

 CME Group and National Oceanic and Atmospheric Administration, as compiled by Bloomberg L.P.

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the U.S. Department of Energy or other federal agencies.

# Short-Term Energy Outlook

## Chart Gallery for January 2019

**West Texas Intermediate (WTI) crude oil price and NYMEX confidence intervals**  
dollars per barrel

Note: Confidence interval derived from options market information for the five trading days ending Jan 10, 2019. Intervals not calculated for months with sparse trading in near-the-money options contracts.  
Source: Short-Term Energy Outlook, January 2019, and CME Group

**U.S. gasoline and crude oil prices**

Source: Short-Term Energy Outlook, January 2019

**Components of annual gasoline price changes**

**U.S. diesel and crude oil prices**

Source: Short-Term Energy Outlook, January 2019

**Components of annual diesel prices changes**

**Henry Hub natural gas price and NYMEX confidence intervals**

dollars per million Btu

Note: Confidence interval derived from options market information for the five trading days ending Jan 10, 2019. Intervals not calculated for months with sparse trading in near-the-money options contracts.

**U.S. electricity consumption**

million kilowatthours per day

Source: Short-Term Energy Outlook, January 2019

**Components of annual change**

million kilowatthours per day

**U.S. renewable energy supply**  
quadrillion British thermal units

**Components of annual change**  
quadrillion British thermal units

Note: Hydropower excludes pumped storage generation. Liquid biofuels include ethanol and biodiesel. Other biomass includes municipal waste from biogenic sources, landfill gas, and other non-wood waste.

- = no data available

Prices are not adjusted for inflation.

(a) Includes lease condensate.

(b) Total consumption includes Independent Power Producer (IPP) consumption.

(c) Renewable energy includes minor components of non-marketed renewable energy that is neither bought nor sold, either directly or indirectly, as inputs to marketed energy.

EIA does not estimate or project end-use consumption of non-marketed renewable energy.

(d) The conversion from physical units to Btu is calculated using a subset of conversion factors used in the calculations of gross energy consumption in EIA's Monthly Energy Review. Consequently, the historical data may not precisely match those published in the MER or the Annual Energy Review (AER).

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109;*Petroleum Supply Annual*, DOE/EIA-0340/2; *Weekly Petroleum Status Report*, DOE/EIA-0208; *Petroleum Marketing Monthly*, DOE/EIA-0380; *Natural Gas Monthly*, DOE/EIA-0130;*Electric Power Monthly*, DOE/EIA-0226; *Quarterly Coal Report*, DOE/EIA-0121; and *International Petroleum Monthly*, DOE/EIA-0520.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model. U.S. macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

Weather projections from National Oceanic and Atmospheric Administration.

**Table 2. Energy Prices**

- = no data available

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates,

(a) Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

(b) Includes lease condensate, natural gas plant liquids, other liquids, and refinery processing gain. Includes other unaccounted-for liquids.

 (c) Consumption of petroleum by the OECD countries is synonymous with "petroleum product supplied," defined in the glossary of the EIA *Retroroleum Supply Monthly*, DOE/EIA-0109.

Consumption of petroleum by the non-OECD countries is "apparent consumption," which includes internal consumption, refinery fuel and loss, and bunkering.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

OPEC = Organization of the Petroleum Exporting Countries: Algeria, Angola, Congo (Brazzaville), Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Saudi Arabia, the United Arab Emirates,

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Supply includes production of crude oil (including lease condensates), natural gas plant liquids, biofuels, other liquids, and refinery processing gains.

Not all countries are shown in each region and sum of reported country volumes may not equal regional volumes.

**Historical data:** Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 3c. OPEC Crude Oil (excluding condensates) Supply (million barrels per day)**

OECD = Organization for Economic Cooperation and Development: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Latvia, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States.

(a) Weighted geometric mean of real indices for various countries with weights equal to each country's share of world oil consumption in the base period. Exchange rate is measured in foreign currency per U.S. dollar. GDP and exchange rate data are from Oxford Economics, and oil consumption data are from EIA.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration international energy statistics.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Includes lease condensate.

(b) Crude oil production from U.S. Federal leases in the Gulf of Mexico (GOM).

(c) Net imports equals gross imports minus gross exports.

(d) Crude oil adjustment balances supply and consumption and was previously referred to as "Unaccounted for Crude Oil."

(e) Renewables and oxygenate production includes pentanes plus, oxygenates (excluding fuel ethanol), and renewable fuels.

(f) Petroleum products adjustment includes hydrogen/oxygenates/renewables/other hydrocarbons, motor gasoline blend components, and finished motor gasoline.

(g) "Other Oils" includes aviation gasoline blend components, finished aviation gasoline, kerosene, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt and road oil, still gas, and miscellaneous products.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

SPR: Strategic Petroleum Reserve

HC: Hydrocarbons

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Petroleum Supply Monthly*, DOE/EIA-0109; *Petroleum Supply Annual*, DOE/EIA-0340/2; and *Weekly Petroleum Status Report*, DOE/EIA-0208.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 4b. U.S. Hydrocarbon Gas Liquids (HGL) and Petroleum Refinery Balances (million barrels per day, except inventories and utilization factor)**

- = no data available

(a) Marketed production from U.S. Federal leases in the Gulf of Mexico.

(b) The balancing item represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas demand.

(c) Natural gas used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

 (d) For a list of States in each inventory region refer to *Weekly Natural Gas Storage Report, Notes and Definitions* (<http://ir.eia.gov/ngs/notes.html>) .

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

LNG: liquefied natural gas.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Natural Gas Monthly* , DOE/EIA-0130; and *Electric Power Monthly* , DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Waste coal includes waste coal and coal slurry reprocessed into briquettes.

(b) Coal used for electricity generation and (a limited amount of) useful thermal output by electric utilities and independent power producers.

(c) The discrepancy reflects an unaccounted-for shipper and receiver reporting difference, assumed to be zero in the forecast period.

(d) Primary stocks are held at the mines and distribution points.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Quarterly Coal Report*, DOE/EIA-0121; and *Electric Power Monthly*, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available. kWh = kilowatthours. Btu = British thermal units.

Prices are not adjusted for inflation.

(a) Generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities and independent power producers.

(b) Generation supplied by CHP and electricity-only plants operated by businesses in the commercial and industrial sectors, primarily for onsite use.

(c) Includes transmission and distribution losses, data collection time-frame differences, and estimation error.

 (d) Direct Use represents commercial and industrial facility use of onsite net electricity generation; and electrical sales or transfers to adjacent or collocated facilities for which revenue information is not available. See Table 7.6 of the EIA *Monthly Energy Review*.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Total retail sales to all sectors includes residential, commercial, industrial, and transportation sector sales.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Retail Sales represents total retail electricity sales by electric utilities and power marketers.

Regions refer to U.S. Census divisions.

 See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

**Historical data:** Latest data available from Energy Information Administration databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226; and *Electric Power Annual*, DOE/EIA-0348.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

(a) Residual fuel oil, distillate fuel oil, petroleum coke, and other petroleum liquids.

(b) Batteries, chemicals, hydrogen, pitch, purchased steam, sulfur, nonrenewable waste, and miscellaneous technologies.

(c) Conventional hydroelectric and pumped storage generation.

(d) Wind, biomass, geothermal, and solar generation.

**Notes:** Data reflect generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities, independent power producers, and the commercial and industrial sectors. The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from U.S. Energy Information Administration *Electric Power Monthly* and *Electric Power Annual*.

**Projections:** EIA Regional Short-Term Energy Model.

**Table 7e. U.S. Regional Fuel Consumption for Electricity Generation, All Sectors**

(a) Petroleum coke consumption converted from short tons to barrels by multiplying by five.

(b) Other petroleum liquids include jet fuel, kerosene, and waste oil.

**Notes:** Data reflect generation supplied by electricity-only and combined-heat-and-power (CHP) plants operated by electric utilities, independent power producers, and the commercial and industrial sectors. Data include fuel consumed only for generation of electricity. Values do not include consumption by CHP plants for useful thermal output.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Physical Units: st/d = short tons per day; b/d = barrels per day; cf/d = cubic feet per day; mmb = million barrels.

**Historical data:** Latest data available from U.S. Energy Information Administration *Electric Power Monthly* and *Electric Power Annual*.

**Projections:** EIA Regional Short-Term Energy Model.

- = no data available

(a) Conventional hydroelectric power only. Hydroelectricity generated by pumped storage is not included in renewable energy.

(b) Solar consumption in the electric power, commercial, and industrial sectors includes energy produced from large scale (>1 MW) solar thermal and photovoltaic generators and small-scale (<1 MW) distributed solar photovoltaic systems.

(c) Municipal solid waste from biogenic sources, landfill gas, sludge waste, agricultural byproducts, and other biomass.

(d) Losses and co-products from the production of fuel ethanol and biomass-based diesel

(e) Solar consumption in the residential sector includes energy from small-scale (<1 MW) solar photovoltaic systems. Also includes solar heating consumption in all sectors.

(f) Fuel ethanol and biomass-based diesel consumption in the transportation sector includes production, stock change, and imports less exports. Some biomass-based diesel may be consumed in the residential sector in heating oil.

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

**Historical data:** Latest data available from EIA databases supporting the following reports: *Electric Power Monthly*, DOE/EIA-0226 and *Renewable Energy Annual*, DOE/EIA-0603; *Petroleum Supply Monthly*, DOE/EIA-0109.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA Regional Short-Term Energy Model.

-- = no data available

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

(a) Power plants larger than or equal to one megawatt in size that are operated by electric utilities or independent power producers.

(b) Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

(c) Businesses or individual households not primarily engaged in electric power production for sale to the public, whose generating capacity is at least one megawatt (except for small-scale solar photovoltaic data, which consists of systems smaller than one megawatt).

(d) Solar photovoltaic systems smaller than one megawatt, as measured in alternating current.

**Historical data:** Latest data available from EIA databases supporting the Electric Power Monthly, DOE/EIA-0226.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** EIA-860M database, EIA-826 Solar PV database, and EIA Regional Short-Term Energy Model.

- = no data available

**Notes:** The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions.

 See "Census division" in EIA's Energy Glossary (<http://www.eia.doe.gov/glossary/index.html>) for a list of States in each region.

**Historical data:** Latest data available from U.S. Department of Commerce, Bureau of Economic Analysis; Federal Reserve System, Statistical release G17.

Minor discrepancies with published historical data are due to independent rounding.

**Projections:** Macroeconomic projections are based on the IHS Markit model of the U.S. Economy.

- = no data available

**Notes:** Regional degree days for each period are calculated by EIA as contemporaneous period population-weighted averages of state degree day data published by the National Oceanic and Atmospheric Administration (NOAA).

See *Change in Regional and U.S. Degree-Day Calculations* ([http://www.eia.gov/forecasts/steo/special/pdf/2012\\_sp\\_04.pdf](http://www.eia.gov/forecasts/steo/special/pdf/2012_sp_04.pdf)) for more information.

The approximate break between historical and forecast values is shown with historical data printed in bold; estimates and forecasts in italics.

Regions refer to U.S. Census divisions. See "Census division" in EIA's Energy Glossary (<http://www.eia.gov/tools/glossary/>) for a list of states in each region.

**Historical data:** Latest data available from U.S. Department of Commerce, National Oceanic and Atmospheric Association (NOAA).

**Projections:** Based on forecasts by the NOAA Climate Prediction Center (<http://www.cpc.ncep.noaa.gov/pacdir/DDdir/NHOME3.shtml>).
