The Outlook for Oil and Natural Gas Production in the United States: Short- and Long-term Perspectives

44th Annual International Energy Conference
The International Research Center for Energy and Economic Development
April 25, 2017 | Boulder, CO

By
Howard Gruenspecht, Acting Administrator
Short-term view
Global crude oil balances are expected to tighten through 2018

World liquid fuels production and consumption balance

Million barrels per day (MMb/d)

Source: Short-Term Energy Outlook, April 2017

Howard Gruenspecht, ICEED
April 25, 2017
WTI is forecast to average $52/barrel in 2017 and $55/barrel in 2018; Brent averages $2/barrel above WTI in both years

Note: Confidence interval derived from options market information for the 5 trading days ending Apr 6, 2017. Intervals not calculated for months with sparse trading in near-the-money options contracts.

Long-term U.S. projections
Key takeaways from AEO2017

• With strong domestic production and relatively flat demand, the United States becomes a net energy exporter over the projection period in most cases

• U.S. crude oil production rebounds from recent lows, driven by continued development of tight oil resources; with consumption flat to down compared to recent history, net crude oil and petroleum product imports as a percentage of U.S. product supplied decline across most cases

• Across most cases, natural gas production increases despite relatively low and stable prices, supporting higher levels of domestic consumption and natural gas exports

• With modest electricity demand growth, the primary driver for new electricity generation capacity in the Reference case is the retirement of fossil fuel units, largely spurred by the Clean Power Plan (CPP), the near-term availability of renewable tax credits, state-level policies to promote renewables, and nuclear retirements; even if the CPP is not implemented natural gas and renewables are the primary sources of new generation capacity; the future generation mix is sensitive to the price of natural gas and the growth in electricity demand
Key takeaways from AEO2017 (continued)

• Transportation energy consumption peaks in 2018 in the Reference case because rising fuel efficiency outweighs increases in total travel and freight movements throughout the projection period.

• Despite growth in the number of households and the amount of commercial floorspace, improved equipment and efficiency standards contribute to residential and commercial energy consumption remaining relatively flat or declining slightly from 2016 to 2040 in the Reference case.

• With economic growth and relatively low energy prices, industrial energy consumption increases during the projection period across all cases; energy intensity declines in the Reference case and most side cases as a result of technological improvements.
Why long-term projections might/could/will be wrong

- Different relative fuel prices
- Faster / slower economic and energy demand growth
- Changing policies and regulations
- Changing consumer preferences
- Faster / slower technology progress
- Technology breakthroughs
AEO2017 includes side cases with different assumptions of macroeconomic growth, world oil prices, technological progress, and energy policies

- Oil prices are primarily driven by global market balances that are mainly influenced by factors external to the NEMS model; in the Reference case, oil prices reach $109/b in 2016 dollars, compared to $43/b in the Low Oil Price case and $228/b in the High Oil Price case.

- In the High Oil and Gas Resource and Technology case, lower costs and higher resource availability than in the Reference case allow for higher production at lower prices; in the Low Oil and Gas Resource and Technology case, more pessimistic assumptions about resources and costs are applied.

- The effects of economic assumptions on energy consumption are addressed in the High and Low Economic Growth cases, which assume compound annual growth rates for U.S. gross domestic product of 2.6% and 1.6%, respectively, from 2016–40, compared with 2.2% annual growth in the Reference case.

- A case assuming that the Clean Power Plan (CPP) is not implemented can be compared to the Reference case to show how that policy could affect energy markets and emissions.
Energy consumption varies modestly across the AEO cases, bounded by the High and Low Economic Growth cases.

**Total energy consumption**

**Quadrillion British thermal units**

Transportation
Transportation energy use declines between 2018 and 2034 in the Reference case, driven by improvements in fuel economy.

Source: EIA, Annual Energy Outlook 2017
Average light-duty fuel economy improves in the Reference case, even as the share of light-duty trucks increases.

Source: EIA, Annual Energy Outlook 2017
Sales of battery electric, plug-in electric hybrid, and fuel cell vehicles increase in the Reference case because of lower projected battery costs and existing state policies.

new light-duty vehicle sales
thousands of vehicles

Source: EIA, Annual Energy Outlook 2017
With the second phase of fuel efficiency regulations, medium- and heavy-duty vehicle energy consumption declines over 2027-33 despite continued growth in miles traveled

**travel indicator**
- billion vehicle-miles traveled

**stock fuel economy**
- miles per gallon

**energy consumption**
- quadrillion British thermal units

Source: EIA, Annual Energy Outlook 2017
Even with improving commercial aircraft efficiency, jet fuel use rises in the Reference case with increased travel.

Source: EIA, Annual Energy Outlook 2017
Food for thought – transportation

• Ride sharing

• Autonomous vehicle technology in both passenger and freight applications

• Actual uptake of vehicles fueled by electricity and/or hydrogen

• Teleworking and telepresence

• Possible pursuit of deep decarbonization

• Future vehicle efficiency and taxation policies
Hydrocarbon production and trade
Reference case oil prices and production rise from current levels, price paths and production levels in the side cases are very different from those in the Reference case.
Tight oil dominates U.S. production in the Reference case, but other types of oil production continue to yield significant volumes.

Source: EIA, Annual Energy Outlook 2017
In the High Oil Price and the High Oil and Gas Resource and Technology cases, the United States becomes a net petroleum exporter.
U.S. dry natural gas production is the result of continued development of shale gas and tight oil plays, alternative assumptions cause significant differences.

Source: EIA, Annual Energy Outlook 2017
Increasing demand from industrial and electric power markets drive rising domestic consumption of natural gas in the Reference case.

- **Howard Gruenspecht, ICEED**
- **April 25, 2017**

**Source:** EIA, Annual Energy Outlook 2017
Increased natural gas trade is dominated by liquefied natural gas exports in the Reference case.

Source: EIA, Annual Energy Outlook 2017
U.S. LNG export levels vary across cases and reflect both the level of global demand, as well as by the difference between domestic and global natural gas prices.

Source: EIA, Annual Energy Outlook 2017
Future domestic natural gas prices depend on both domestic resource availability and world energy prices.

Henry Hub natural gas price
2016 dollars per million Btu

Source: EIA, Annual Energy Outlook 2017
Food for thought – hydrocarbon production and trade

• Technology developments – to what extent will they continue to offset depletion of hydrocarbon resources

• Geopolitics in key producing regions – both internationally and within the United States

• Possible pursuit of deep decarbonization, particularly in transportation applications

• Technologies and policies affecting vehicle choice, given dominant role of transportation sector in oil demand
