International Energy Outlook 2017

for
Center for Strategic and International Studies
September 14, 2017 | Washington, DC

by
Dr. Ian Mead, Assistant Administrator for Energy Analysis
World energy consumption increases from 575 quadrillion Btu in 2015 to 736 quadrillion Btu in 2040, a 28% increase.

More than 60% of the increase in energy consumption by 2040 comes from non-OECD Asia, which includes China and India.

Even though demand in the residential and transportation sectors grows more rapidly, the industrial sector still accounts for over 50% of delivered energy consumption in 2040.

Transportation energy use rises by nearly 30% between 2015 and 2040 with almost all of the growth occurring in non-OECD regions.
Key takeaways: IEO2017 Reference case (continued)

- Renewable energy is the world’s fastest-growing energy source, increasing an average 2.3%/year between 2015 and 2040

- Fossil fuels remain dominant, supplying 77% of the world’s energy consumption in 2040

- Natural gas is the fastest growing fossil fuel with global consumption increasing an average 1.4%/year between 2015 and 2040

- Coal use remains flat over the projection period as declines in China are largely offset by increases in India and other parts of Asia

- World energy-related carbon dioxide emissions are projected to grow an average 0.6%/year between 2015 and 2040, far below the 1.3%/year growth from 1990 to 2015
IEO2017 addresses the uncertainty inherent in energy projections by developing side cases focusing on overall energy consumption

• The effects of assumptions about economic growth on energy consumption are addressed in the High and Low Economic Growth cases. World gross domestic product increases by 3.3%/year from 2015 to 2040 in the High Economic Growth case and by 2.7%/year in the Low Economic Growth case, compared with 3.0%/year in the Reference case.

• The High and Low Oil Price cases address the uncertainty associated with the trajectory of world energy prices. In the Low Oil Price case, the price of North Sea Brent crude in 2016 dollars reaches $43/barrel by 2040, compared with $109/barrel in the Reference case and $226/barrel in the High Oil Price case.

• Although the graphics in this presentation focus on projections through 2040, this IEO is the first projection to include model results through 2050, which are available on the IEO page of the EIA website; EIA welcomes feedback on the assumptions and results over the period of 2040–50.
World energy consumption rises 28% between 2015 and 2040 in the Reference case with most of the increase occurring in non-OECD countries.

IEO2017 will feature four Issues in Focus articles which will be released over the next several months

• This year’s IEO includes supplementary analyses which discuss particular areas of uncertainty and consider how changing assumptions affect results.

• Two of these articles provide alternative projections by varying assumptions.
  – Transportation and Electric Vehicle Penetration
  – Economic Growth Rates (China and India)

• Two of these articles provide insight on how EIA considers evolving energy markets.
  – Investment in Oil and Gas Resources
  – Paris Climate Agreement
