Oil and gas outlook

For
National Capital Area Chapter of the U.S. Association for Energy Economics
October 16, 2015 | Washington, DC

By
Adam Sieminski, Administrator
U.S. Energy Information Administration
The U.S. has experienced a rapid increase in natural gas and oil production from shale and other tight resources

U.S. tight oil production
million barrels of oil per day

- Eagle Ford (TX)
- Bakken (MT & ND)
- Spraberry (TX & NM Permian)
- Bone Spring (TX & NM Permian)
- Wolfcamp (TX & NM Permian)
- Delaware (TX & NM Permian)
- Yeso-Glorieta (TX & NM Permian)
- Niobrara-Codell (CO, WY)
- Haynesville
- Utica (OH, PA & WV)
- Marcellus (PA, WV, OH & NY)
- Woodford (OK)
- Granite Wash (OK & TX)
- Austin Chalk (LA & TX)
- Monterey (CA)

0.0 0.5 1.0 1.5 2.0 2.5 3.0 3.5 4.0 4.5 5.0

U.S. dry shale gas production
billion cubic feet per day

- Marcellus (PA, WV, OH & NY)
- Haynesville (LA & TX)
- Eagle Ford (TX)
- Fayetteville (AR)
- Barnett (TX)
- Woodford (OK)
- Bakken (ND)
- Antrim (MI, IN, & OH)
- Utica (OH, PA & WV)
- Rest of US 'shale'

0 5 10 15 20 25 30 35 40 45

Sources: EIA derived from state administrative data collected by DrillingInfo Inc. Data are through August 2015 and represent EIA’s official tight oil & shale gas estimates, but are not survey data. State abbreviations indicate primary state(s).
Production growth in top U.S. crude producing regions (Permian, Bakken, Niobrara, and Eagle Ford) reversed in early 2015

U.S. becomes a net exporter of natural gas in the near future

U.S. dry natural gas trillion cubic feet per year

Source: EIA, Annual Energy Outlook 2015
Key takeaways - Oil

• Tight oil clearly matters for measures of U.S. oil import dependence and ability to pressure OPEC

• Policy debate over removing restrictions on exports of U.S. crude oil
  – Recent EIA analysis shows no significant effects for consumers, producers, or refiners in cases where domestic production remains below 11 million barrels per day (b/d)
  – If U.S. production were to approach or exceed 12 million b/d, as might occur under high resource assumptions, U.S. consumers realize a small reduction in gasoline prices and crude producers, modestly raise output if crude export restrictions are removed; however, the largest effects (in opposite directions) are felt by producers and refiners

• The Middle East remains the center of “easy oil” and will remain key to the future of the global oil market
How much will low prices stimulate oil demand?
The direct price effects can raise gasoline demand---as occurred recently in the United States.

Gasoline demand estimates vary

The macro impacts are also important---Non-OECD oil consumption growth declined recently as GDP growth slowed.

Source: Energy Information Administration, IHS Global Insight (as of September 2015)

* Oil consumption weighted GDP
Prices and economic growth are important, but policy, preferences, and technology may have a bigger long-term impact

• What types of consumption and pricing policies will be enacted across the world?
  – Fuel subsidies
  – Environmental policies
  – Domestic security policies

• What will light-duty vehicle trends look like?
  – Ownership rates
  – Efficiency and emissions standards
  – Technology/alternative fuels

• Where will goods be produced and how will they be moved?

• Will there be major industrial sector efficiency improvements or fuel switching?
2015 – 2016 Winter Fuels Outlook
NOAA forecasts U.S. heating degree days this winter to be 7% lower than last winter and below the 10-year average

*Propane expenditures are a volume-weighted average of the Northeast and Midwest regions. All others are U.S. volume-weighted averages. Propane prices do not reflect prices locked in before the winter heating season starts.

Source: EIA Short-Term Energy Outlook, October 2015.
Key takeaways – winter fuels

• EIA expects heating fuel prices for homes that heat with natural gas, propane, and heating oil to be lower than prices last winter; residential electricity prices are expected to be about the same as last winter.

• The latest outlook from government weather forecasters expects winter temperatures east of the Rocky Mountains to be warmer than last winter, with projected heating degree days in the Northeast, Midwest, and South respectively about 13%, 11%, and 8% lower; in the West, this winter is expected to be 12% colder than last winter.

• Projected changes in average U.S. household heating fuel expenditures from last winter are:
  – 10% lower for homes that heat primarily with natural gas
  – 25% lower for homes using oil heat
  – 18% lower for homes using propane heat
  – 3% lower for homes that heat with electricity
Heating oil prices are forecast to be 15% lower than last winter, propane prices are forecast to be 10% lower, and natural gas prices are forecast to be 4% lower.

U.S. average residential winter heating fuel prices (dollars per million Btu)
