• International Energy Outlook
EIA Winter Fuels Outlook
Heating fuel market shares vary regionally

Share of homes by primary space heating fuel and Census Region

Source: U.S. Census Bureau, 2012 American Community Survey
Expenditures are expected to be higher this winter (October 1–March 31) for natural gas, propane, electricity; lower for heating oil

<table>

* Propane expenditures are a volume-weighted average of the Northeast and Midwest regions. All others are U.S. volume-weighted averages. Propane prices in warm and cold cases are not available.

Source: EIA Short-Term Energy Outlook, October 2013
Although forecast natural gas expenditures are significantly higher, they are still lower than the previous 5-year average.

% change in fuel expenditures

- natural gas
- electricity
- heating oil
- propane

Note: All prices are U.S. averages except propane, which is an average of Northeast and Midwest prices. Source: EIA Short-Term Energy Outlook, October 2013.
The differences between natural gas, heating oil, and propane prices narrow this winter, with natural gas price 14% higher, heating oil price down 5%, and propane price up 9%.

Source: EIA Short-Term Energy Outlook, October 2013
Key insights of the winter fuels outlook

- EIA expects higher prices this winter for homes that heat with natural gas, propane, and electricity; home heating oil prices are expected to be lower than last winter.

- Forecast temperatures are close to last winter with the Northeast about 3% colder and the West 3% warmer.

- Projected changes in residential expenditures from last winter are:
  - 13% higher for homes that heat primarily with natural gas
  - 9% higher for propane
  - 2% higher for electricity
  - 2% lower for heating oil

- Although natural gas expenditures are significantly higher, they are still lower than the previous 5-year average.
EIA Drilling Productivity Report
Six key plays account for nearly all recent growth in production

Source: EIA Drilling Productivity Report
The gas-directed rig count plummeted in 2009 but natural gas production did not follow.

Source: Baker Hughes, Inc. rig count, EIA Short-Term Energy Outlook
Oil and natural gas are increasingly developed from the same wells

Source: EIA analysis of data from DrillingInfo, Inc.
Oil production has continued to rise in 2013 despite a leveling off of rig counts.

Source: Baker Hughes, Inc. rig count, EIA Short-Term Energy Outlook
EIA’s Drilling Productivity Report (DPR) uses a series of new metrics to assess the production and depletion trends of oil and natural gas wells

- Rig count
- Well classification
- Drilling efficiency
- Productivity of new wells
- Production and depletion trends
Key insights on drilling productivity and production trends

• Higher drilling efficiency and new well productivity, rather than an increase in the rig count, have been the main drivers of recent production growth

• In the six plays considered, steep legacy production decline rates offset new well production by 69% for oil and 73% for natural gas

• Understanding the positive and negative forces that affect production volumes in a given region allows the estimation of the number of rigs required to make up for the natural loss of production from existing wells

• Considering new and existing wells separately helps to highlight plays where the growing number of relatively new wells leads to large monthly declines in legacy production, putting more pressure on increasing production from new wells in order to keep net output rising
Rigs needed to sustain production in the Bakken play

Geopolitical implications of shale
The U.S. has experienced a rapid increase in natural gas and oil production from shale and other tight resources

**Note:** Dry shale gas production data are based on LCI Energy Insight gross withdrawal estimates as of June 2013, converted to dry production estimates with EIA-calculated average gross-to-dry shrinkage factors by state and/or shale play.

**Source:** EIA based on DrillingInfo and LCI Energy Insight
U.S. crude oil and natural gas production is up dramatically since 2010 and will continue to grow rapidly; this has strategic implications for the United States:

- Refinery operations/investment
- Logistics infrastructure investment
- Exports of petroleum products
- Exports of crude oil and natural gas (LNG)
- Management of Strategic Petroleum Reserve
Domestic crude availability and low natural gas prices have supported product exports

Note: ARI estimates U.S. shale oil resources at 48 billion barrels and U.S. shale gas resources at 1,161 trillion cubic feet.
Source: United States: EIA and USGS; Other basins: ARI
Reproducibility of shale development may have limits

Many factors support production from U.S. shale resources that do not exist in many other countries:

- Resource quality and geologic distribution details matter
- Major private ownership of subsurface mineral rights, often by surface owners, provides a strong incentive for development
- Availability of many independent operators and supporting contractors with critical expertise and advanced technology
- Pre-existing gathering and pipeline infrastructure
- Public acceptance of hydraulic fracturing as well as related activities, including transportation of material, and availability and disposal of water/wastewater; population density
Geopolitical implications of shale resources

• Shale oil is both light and sweet — the rapid growth in its supply has implications for crude oil pricing relationships, the value of different refinery configurations, refinery output slates, and the correspondence between SPR holdings and U.S. crude imports

• China’s success in shale development and its future LNG imports (and coal use) are inversely related

• Russia’s share of Europe’s gas market could be reduced by increased European shale production

• High volumes of shale oil production, with other drivers, could significantly diminish the market share and pricing power of key OPEC producers

• Shorter lead times for the ‘manufacturing’ model of production from shale resources may reduce price volatility (over an extended period) compared to the historical ‘exploration/development’ model for conventional resources
EIA International Energy Outlook
Key findings of the EIA’s International Energy Outlook 2013

• With world GDP rising by 3.6 percent per year, world energy use will grow by 56 percent between 2010 and 2040; half of the increase is attributed to China and India

• Renewable energy and nuclear power are the world’s fastest-growing energy sources, each increasing by 2.5 percent per year; however, fossil fuels continue to supply almost 80 percent of world energy use through 2040

• Natural gas is the fastest growing fossil fuel in the outlook, supported by increasing supplies of shale gas, particularly in the United States

• Coal grows faster than petroleum consumption until after 2030, mostly due to increases in China’s consumption of coal, and slow growth in oil demand in OECD member countries

• Given current policies and regulations, worldwide energy-related carbon dioxide emissions are projected to increase 46 percent by 2040, reaching 45 billion metric tons in 2040
Renewable energy and nuclear power are the fastest growing source of energy consumption out to 2040.

OPEC crude oil disruptions have reduced global surplus oil production capacity

surplus oil production capacity
million barrels per day

Sources: EIA, Short-Term Energy Outlook, September 2013; Monthly Oil Market Report
By 2040, China’s energy use will be double the U.S. level; India’s a little more than half despite its faster GDP growth.
World energy-related carbon dioxide emissions by fuel type, 1990-2040

There are many issues that increase uncertainty…

- Unresolved long-term effects of economic issues in the United States, Europe, and China
- The timing of Japan’s full recovery from the impacts of the 2011 nuclear disaster at Fukushima
- Social unrest in the Middle East and North Africa, and the potential for unrest elsewhere
- Shale gas and shale oil production potential
- OPEC market share decisions
- Climate policies
